What is a flywheel energy storage system?

Flywheel energy storage systems (FESS) are a great way to store and use energy. They work by spinning a wheel really fast to store energy, and then slowing it down to release that energy when needed. FESS are perfect for keeping the power grid steady, providing backup power and supporting renewable energy sources.

What is the Amber Kinetics flywheel energy storage system (fess)?

The Amber Kinetics flywheel is the first commercialized four-hour discharge, long-duration Flywheel Energy Storage System (FESS) solution powered by advanced technology that stores 32 kWh of energy in a two-ton steel rotor. Individual flywheels can be scaled up to tens or even hundreds of megawatts.

Can flywheel energy storage be commercially viable?

This required advancing the design, manufacturing capability, system cost, storage capacity, efficiency, reliability, safety, and system level operation of flywheel energy storage technology.

What type of energy is stored in a flywheel?

The principle of rotating mass causes energy to store in a flywheel by converting electrical energy into mechanical energy in the form of rotational kinetic energy.

How many megawatts can a flywheel support?

Individual flywheels can be scaled up to tens or even hundreds of megawatts. Amber Kinetics has engineered a highly efficient flywheel to meet the energy storage needs of the modern grid. Amber Kinetics flywheels can be installed to support a huge range of diverse energy storage needs.

How does rotation store energy in a flywheel?
