The aim of this research is to establish a criterion whose purpose is to calculate the price of the complete stage in which the electricity enters and exists after the storage system. As a result, any electrical energy storage system under consideration could be evaluated and compared with other storage systems.

Deep storage systems, capable of dispatching electricity for over 12 hours continuously, can help stabilize fluctuations in daily energy demand and renewable energy supply. The deepest storage options currently available to ...

Thermal energy storage systems (TESS) store energy in the form of heat for later use in electricity generation or other heating purposes. This storage technology has great potential in both industrial and residential applications, such as heating and cooling systems, and load shifting [9].
