Why do lithium ion batteries have a low temperature electrochemical performance?

See all authors Due to the strong affinity between the solvent and Li⁺, the desolvation process of Li⁺ at the interface as a rate-controlling step slows down, which greatly reduces the low-temperature electrochemical performance of lithium-ion batteries (LIBs) and thus limits its wide application in energy storage.

Specifically, the prospects of using lithium-metal, lithium-sulfur, and dual-ion batteries for performance-critical low-temperature applications are evaluated. These three chemistries are presented as prototypical examples of how the conventional low-temperature charge-transfer resistances can be overcome.
