Pictured above, it has a total installed capacity of 30MW with 120 high-speed magnetic levitation flywheel units. Every 12 units create an energy storage and frequency regulation unit, the firm said, with the 12 combining to form an array connected to the grid at a 110 kV voltage level.

Flywheel energy storage (FES) works by accelerating a rotor (flywheel) to a very high speed and maintaining the energy in the system as rotational energy. The energy is converted back by slowing down the flywheel. Most FES systems use electricity to accelerate and decelerate the flywheel, but devices that directly use mechanical energy are being developed.
