

Are vanadium redox flow batteries the future?

Called a vanadium redox flow battery (VRFB), it's cheaper, safer and longer-lasting than lithium-ion cells. Here's why they may be a big part of the future-- and why you may never see one. In the 1970s, during an era of energy price shocks, NASA began designing a new type of liquid battery.

Does vanadium degrade in flow batteries?

Vanadium does not degrade flow batteries. According to Brushett, If you put 100 grams of vanadium into your battery and you come back in 100 years, you should be able to recover 100 grams of that vanadium--as long as the battery doesn't have some sort of a physical leak'.

Will flow battery suppliers compete with metal alloy production to secure vanadium supply?

Traditionally,much of the global vanadium supply has been used to strengthen metal alloys such as steel. Because this vanadium application is still the leading driver for its production, it's possible that flow battery suppliers will also have to compete with metal alloy production to secure vanadium supply.
